Hanford Site 2006 Illness and Injury Surveillance Report

At A Glance

The Hanford work force has decreased 42 percent from a high of 19,655 employees in 1994 to 11,334 employees in 2006. The average age of the work force has decreased since 2005, which is related to hiring younger workers as the work force increased from a low of 10,077 in 2004 to 11,334 in 2006. This decrease in age is contrary to the overall increase in the age of the work force we saw among Illness and Injury Surveillance Program (IISP) sites between 1995 and 2004.

Women reported 380 diagnoses and men reported 1,178 diagnoses in 2006. The number of reported diagnoses decreased 30 percent from 2002 to 2006. The work force decreased 23 percent during the same period.

The age-adjusted rates for all diagnoses combined declined 57 percent among women from 2003 to 2006, while the rates for men have remained steady. Since 2005, the rates for women have been lower than the rates for men. This is contrary to what we saw from 1995 to 2004 among the IISP sites overall, for which the rates among women were at least 50 percent higher than the rates for men.

Contrary to the steady downward trend in the overall rates for all diagnoses combined, the rates increased among men in the Technical Support, Service, and Security and Fire occupational groups and among women in the Security and Fire group from 2003 to 2006.

Hanford workers reported 37 diagnoses for cancer in 2006. None of the 35 workers who reported a cancer diagnosis in 2006 reported cancer in previous years. The rate of reported cancer diagnoses has been steady since 2003.

The rate of prostate cancer diagnoses, which is usually the most frequently reported cancer among men each year, has fallen since 2002, the year with the highest rate since 1992. Four men reported a prostate cancer diagnosis in 2006 compared with 9 men in 2005 and 12 men in 2004. No diagnoses for prostate cancer were reported in 2003. We saw no evidence that any occupational group was represented in excess or that the age distribution was unusual among men reporting this disease.

Among women, breast cancer made up 64 percent (7 diagnoses) of the 11 cancer diagnoses reported in 2006. This is the highest number of breast cancer diagnoses reported in any year since 2002 when 10 diagnoses were reported by 9 women.

Hanford reported 224 definite sentinel health event diagnoses in 2006, including 3 diagnoses for chronic beryllium disease among men. The number of sentinel health event diagnoses has decreased significantly from the 305 diagnoses reported in 2002.

In 2006, Security and Fire workers had the highest rate of OSHA-recordable events among men and Crafts workers the highest rates among women.

The number of OSHA-recordable events has experienced a more than 3.5-fold decrease, from 251 events reported in 2000 to 69 events reported in 2006. This pattern follows the trends seen nationally as well as within DOE.

Ninety-six percent (66/69) of the OSHA events were the result of an accident. Overexertion and strenuous movements accounted for half of these accidents. The second most common type of accident resulted from falls and being struck by an object.

Sentinel Health Events for Occupations (SHEOs)

An occupational sentinel health event (SHEO) is a disease, disability, or death that is likely to be occupationally related. Although sentinel health events may indicate an occupational exposure, many may result from nonoccupational exposures. Sentinel health events are therefore assessed in two categories:

Definite Sentinel Health Events: Diseases that are unlikely to occur in the absence of an occupational exposure (e.g., asbestosis).

Possible Sentinel Health Events: Diseases that may be occupational but can also occur in the absence of an occupational exposure (e.g., lung cancer or carpal tunnel syndrome).

Figure 16. Characteristics of SHEOs by Gender
