EARLY SIGNS OF BREAST CANCER

- A single lump is found in the breast or under the arm, which is usually painless and firm to the touch.

- An area of the skin on the breast or underarm shows swelling and has an unusual appearance.

- An indentation may occur in an area of the breast surface.

- Individual may notice that veins near the skin surface are more prominent.

- The nipple may change gradually, becoming inverted, developing a rash, showing discharge other than milk, and possibly a rash.

While a history of breast cancer in the family may lead to increased risk, many breast cancers are diagnosed in women with no family history.
