Introduction to Proofs

Submitted by: Maria Rhodes, Geometry
Chattanooga Christian School, Chattanooga, TN

Target Grade: Geometry
Time Required: 75 minutes

Standards

Common Core Math Standards

- CCSS.MATH.CONTENT.HSG.CO.C.9
  Prove theorems about lines and angles.

Lesson Objectives

Students will:

- Solve Equations and justify solutions using a 2-column proof.

Central Focus

The lesson has an activity that uses the game of Uno to introduce proofs. In Uno, there are rules you must follow. These rules can be used to justify certain moves. Thus, students will be engaged with proofs in the form of a game to engage their attention. Writing proofs allows students to practice their logic skills. Logic is used across domains and is necessary for everyday functioning. Students will learn how to write proofs, which will help them organize their thinking and understand how to justify what they are doing.

Key Terms: proofs, addition property, distributive property, subtraction property, multiplication property, division property, substitution property, transitive property, 2-column proofs

Background Information

This lesson builds on the students’ prior knowledge of how to solve equations. The students will be writing proofs that justify each step of solving an equation. To justify their steps, the students will use previously learned properties, such as the additive property, distributive property, and the multiplicative property.
Prior to this lesson, teachers should be familiar with the terms: addition property, distributive property, subtraction property, multiplication property, division property, substitution property and transitive property.

- **Addition property**
  - If $a = b$ and $c = d$, then $a + c = b + d$.

- **Distributive property**
  - $a(b + c) = ab + ac$

---

**Distributive Property**

Let $a$, $b$ and $c$ be real numbers.

**Addition:**

- $a( b + c ) = ab + ac$
- $3(x + 5) = 3x + 15$

**Subtraction:**

- $(b - c)a = ba - ca$
- $(x + 5)3 = 3x + 15$
- $3(x - 5) = 3x - 15$
- $(x - 5)3 = 3x - 15$

*Figure 1: https://www.slideserve.com/ellemo/1-7-distributive-property*
• Subtraction property
  o If \( a = b \) and \( c = d \), then \( a - c = b - d \).

• Multiplication property
  o If \( a = b \), then \( ac = bc \).
• Division property
  o If $a = b$ and $c$ is not 0, then $a/c = b/c$.

• Substitution property
  o If $a = b$, then $a$ can be substituted for $b$ in any equation or inequality.

Figure 2: [http://study.com/academy/lesson/substitution-property-of-equality-definition-examples.html?seekTo=%7B%7Bquiz.questionContent(questionIndex).marker%7D%7D](http://study.com/academy/lesson/substitution-property-of-equality-definition-examples.html?seekTo=%7B%7Bquiz.questionContent(questionIndex).marker%7D%7D)
• Transitive property
  o If a = b and b = c, then a = c.

Materials

• Whiteboard
• Uno Proofs Presentation (taken from MathTeacherCoach.com)
• Proofs Worksheet
• Proofs Worksheet Key
• Exit Ticket
• Exit Ticket Key
Instruction

Introduction (15 min)

- As a warmup, the students will answer the question, “What are the rules of Uno?”

- Facilitate a discussion in which the class will create a list of the rules of Uno.
- Then, have the class complete the Uno proof activity (the teacher will give out the worksheets for the day).
- First, introduce the idea of a two-column proof, showing them a T-chart, with the statements (or “steps”) on the left and the justifications for each step on the right.
- Then, as a class look at an example of using the columns to “prove” a sequence of Uno cards.
- Next, instruct the students to work by themselves on the next two Uno proof problems.

Transition

- Introduce the activity to the students by saying: “Just like there are rules in Uno that we can use to prove our steps, there are rules in algebra to explore these Uno rules.”

Activity (50 min)

- Ask the students to solve the following equation: $4(x-1)+10 = 7x + 3$ to show that $x = 1$.
- Choose one student to show their work on the board.
- Next, show a table of algebraic properties, saying that these are the rules of algebra.
- Do a Think-Pair-Share to identify which property was used in each step of the equation.
- Call on students to share what they thought the justification of the steps were based on the properties.
• As the students give their answers, write out the steps and justifications in a 2-column format.

Figure 5: [https://www.onlinemathlearning.com/two-column-proofs.html](https://www.onlinemathlearning.com/two-column-proofs.html)

• Put the students into groups of 3-4.
• Direct the students to work the next problems on the worksheet in groups.
  - In each group, there will be one manager (to make sure the group is on task), one fact-checker (to make sure what the group is doing is accurate), one reporter (to share the group’s ideas to the class), and for groups of 4, one facilitator (to facilitate discussion between the group and make sure everyone understands the content).
• As the students work, monitor their discussions and select students to present their work during a whole class discussion.
• Next, have the class extend their learning with proofs to prove statements about geometrical objects.
• Begin by asking what types of information could be used as justification in geometry.
• Discuss how the properties of algebra, any definitions, and any postulates can be used.
• Instruct the students to begin filling out the proofs, and the teacher will select students to share their answers when the groups have had several minutes to work.

**Closure (10 min)**

• Hand out the exit ticket.
• End with an exit ticket on which students complete an algebraic proof and fill in missing steps of a geometric proof.
  - On the exit ticket, students have an opportunity to reflect on what they understood well and what they did not understand well during the lesson.

For more information: orise.orau.gov • STEMEd@orau.org
**Differentiation**

**ELL Students**
- Make a copy of the properties table in their language.
- Allow students to use an online dictionary.

**For Students Who Need More Support**
- Provide a “word” bank of statements and reasons they can choose from to write or fill in proofs.
- Provide a table of definitions and postulates that we have covered so far for the students to reference when choosing reasons in their proofs.

**Grouping**
- Students will be arranged in groups of 3-4 students.
- These groups will be heterogeneous to allow students to interact with their peers who have differing levels of knowledge and skills.
- In each group, there will be one manager (to make sure the group is on task), one fact-checker (to make sure what the group is doing is accurate), one reporter (to share the group’s ideas to the class), and for groups of 4, one facilitator (to facilitate discussion between the group and make sure everyone understands the content).

**Advanced Students**
- Allow students to move at a faster pace.
- Have the students help those who need assistance.
- Ask students to do a 2-column proof without any part filled out.

**Assessment**

**Formative Assessment**
- The class discussion will allow the teacher to see how much the students understood the concepts as well as what they may be struggling with.
- Monitoring the students during the activity can allow the teacher to hear what the students are understanding as well as what they may have questions with.

**Summative Assessment**
- The exit ticket assesses whether the students understand how to write an algebraic proof in the 2-column format and whether they can follow the logic of a geometric proof by filling in missing steps.
Sample

- Begin with
- List how to play these cards to
- ‘Prove’

</table>
Let’s go back to algebra:

Solve for x if $4(x-1) + 10 = 7x + 3$.

Go back to your solution. Next to each step, write out which property you used.

1. Given: $\frac{x-1}{2} = 3x + 2$
   Prove: $x = -1$

<table>
<thead>
<tr>
<th>Statements</th>
<th>Reasons</th>
</tr>
</thead>
<tbody>
<tr>
<td>$1. \ \frac{x-1}{2} = 3x + 2$</td>
<td>1. Given</td>
</tr>
<tr>
<td>$2. 2(\frac{x-1}{2}) = 2(3x + 2)$</td>
<td>2.</td>
</tr>
<tr>
<td>$3. x - 1 = 2(3x + 2)$</td>
<td>3.</td>
</tr>
<tr>
<td>$4. x - 1 = 6x + 4$</td>
<td>4.</td>
</tr>
<tr>
<td>$5. x = 6x + 5$</td>
<td>5.</td>
</tr>
<tr>
<td>$6. -5x = 5$</td>
<td>6.</td>
</tr>
<tr>
<td>$7. x = -1$</td>
<td>7.</td>
</tr>
</tbody>
</table>

2. Given: $3x - 10 = 20 - \frac{1}{3}x$
   Prove: $x = 9$

<table>
<thead>
<tr>
<th>Statements</th>
<th>Reasons</th>
</tr>
</thead>
<tbody>
<tr>
<td>$1. 3x - 10 = 20 - \frac{1}{3}x$</td>
<td>2. Given</td>
</tr>
<tr>
<td>$2. 3x + \frac{1}{3}x = 30$</td>
<td>2.</td>
</tr>
<tr>
<td>$3. \ \frac{10}{3}x = 30$</td>
<td>3.</td>
</tr>
<tr>
<td>$4. x = \frac{30}{\frac{10}{3}}$</td>
<td>4.</td>
</tr>
<tr>
<td>$5. x = 9$</td>
<td>5.</td>
</tr>
</tbody>
</table>

Algebraic Properties

- **Addition Property:**
  If $a = b$ and $c = d$, then $a + c = b + d$.

- **Subtraction Property:**
  If $a = b$ and $c = d$, then $a - c = b - d$.

- **Multiplication Property:**
  If $a = b$, then $ac = bc$.

- **Division Property:**
  If $a = b$ and $c$ is not 0, then $a/c = b/c$.

- **Distributive Property:**
  $a(b + c) = ab + ac$.

- **Transitive Property:**
  If $a = b$ and $b = c$, then $a = c$.

- **Substitution Property:**
  If $a = b$, then $a$ can be substituted for $b$ in any equation or inequality.
What about proving geometrical statements? What other justifications could we use (in addition to our properties?)

Try it out!

Given: \( \angle 1 \) and \( \angle 3 \) are vertical angles
Prove: \( \angle 1 \cong \angle 3 \)

</thead>
</table>
Let’s go back to algebra:

Solve for x if \(4(x-1) + 10 = 7x + 3\).

\[
\begin{align*}
4(x-1) + 10 &= 7x + 3 & \text{given} \\
4x - 4 + 10 &= 7x + 3 & \text{distributive property} \\
4x + 10 &= 7x + 7 & \text{addition property} \\
3 &= 3x & \text{subtraction property} \\
1 &= x & \text{division property}
\end{align*}
\]

Go back to your solution. Next to each step, write out which property you used.

Answers may vary depending on each step.

\[
\begin{array}{|c|c|}
\hline
\text{1. Given: } & \frac{x-1}{2} = 3x + 2 \\
\text{Prove: } x = -1 & \text{2. Given: } 3x - 10 = 20 - \frac{1}{3}x \\
\hline
\text{Statements} & \text{Reasons} & \text{Statements} & \text{Reasons} \\
\hline
1. \frac{x-1}{2} = 3x + 2 & 1. \text{Given} & 1. 3x - 10 = 20 - \frac{1}{3}x & 1. \text{Given} \\
2. 2\left(\frac{x-1}{2}\right) = 2(3x + 2) & 2. \text{Multiplication property} & 2. 3(3x - 10) = 3\left(20 - \frac{1}{3}x\right) & 2. \text{Multiplication property} \\
3. x - 1 = 2(3x + 2) & 3. \text{Substitution property} & 3. 9x - 30 = 60 - x & 3. \text{Distributive property} \\
4. x - 1 = 6x + 4 & 4. \text{Distributive property} & 4. 9x = 90 - x & 4. \text{Addition property} \\
5. x = 6x + 4 & 5. \text{Addition property} & 5. 10x = 90 & 5. \text{Addition property} \\
6. -5x = 5 & 6. \text{Subtraction property} & 6. X = 9 & 6. \text{Division property} \\
7. x = -1 & 7. \text{Division property} & & \\
\hline
\end{array}
\]

What about proving geometrical statements? What other justifications could we use (in addition to our properties?)

Answers may vary.
